

Understanding the File Hierarchy in Vue

There are components and there are pages. The pages are referred to as “views” and the building blocks are called components. You can use a router to route the pages, essentially it tell the pathway.

VS-Router

If you are familiar with C++, you know that you can include the file that you are trying to link to. If you are familiar with HTML, you can link by including the CSS file name. How does this happen in Vue?

Router File

//Snippet

```
Vue.use(VueRouter);
```

```
const routes = [  
  {  
    path: "/",  
    name: "Home",  
    component: Home  
  }  
]
```

]; //I think this makes an array of pages

Then you can add a **<router-link to = “/”>Home</router-link>**
